Solar power generation manual tutorial

Overview

What do you need to know before installing a solar system?

If you are planning to install a solar system or buy a solar generator, you must master the basics of electricity and power generation. This means fully understanding what volts, amps, watts, and watt-hours are and how they relate to meeting your power generation needs.

How does a solar power system work?

Power flows from the power plant, works its way through the grid, and ends up in your home. But a solar power system turns that one-way road into a two-way highway, allowing power from your solar panels to feed back into the grid. To put it another way, consider the sun's energy as a river of energy that flows from the sky.

What is included in a DIY solar generator?

Input ports are generally MC 4 solar panel sockets and appropriate inlets for any external power sources you would like to include. Switches typically include a system on/off switch, switches for specific outlets, and switching for accessories. One of the more commonly included accessories in DIY solar generators builds work lights.

What should you consider when designing a solar PV system?

It also delves into many of the most important considerations when designing and customizing new solar photovoltaic (PV) systems from the ground up — including financing, shading, and how best to optimize your customers' savings based on their energy bills and properties' solar power generation potential.

How many components do you need for a basic solar setup?

For a basic solar setup, the above 3 components will suffice. But before you get too happy, there is something that you need to know. The power we get

from the solar setup is direct current (DC). The power we get from wall plugs is alternative current (AC). Which means, you simply cannot plug your house appliances directly into a basic solar setup.

How to install a solar generator?

Insert one of the supplied mounting bolts through the top hole of the clamp and mark its position on the wall of the solar generator case. Now you can remove the battery and drill an appropriately sized hole through the case wall at your mark. Use the set clamp to index the top hole so you can mark the bottom hole.
