Steam turbine generator cooling air inlet

Overview

Turbine inlet air cooling is a group of technologies and techniques consisting of cooling down the intake air of the gas turbine. The direct consequence of cooling the turbine inlet air is power output augmentation. It may also improve the energy efficiency of the system. This technology is widely used in hot climates.

take in filtered, fresh ambient air and compress it in the compressor stage. The compressed air is mixed with fuel in the combustion chamber and ignited. This produces a high-temperature and high-pressure flow.

In areas where there is demand cooling, daily summer on-peak periods coincide with the highest atmospheric temperatures, which may reduce the efficiency and power gas turbines. With the vapor mechanical compression technologies, cooling.

What is a typical gas turbine power plant with inlet air cooling system?

Schematic diagram of a typical gas turbine power plant with inlet air cooling system is shown in Figure-1. It is comprised of a single shaft gas turbine generator, heat recovery steam generator, electric chillers, thermal storage, and heat exchanger for inlet air cooling. The gas turbine generates electricity from combustion of natural gas.

improve the energy efficiency of the system.

Does inlet air cooling improve cogeneration gas turbine power augmentation?

Performance and economic enhancement of cogeneration gas turbine through inlet air cooling Benefits of compressor inlet air cooling for gas turbine cogeneration plants Options in gas turbine power augmentation using inlet air chiller.

Can Inlet air cooling improve the performance of intercooled gas turbine power plants?

In hot climates, the entry of high-temperature air into the compressor of intercooled gas turbine power plants (IcGTCC) can lead to reduced electricity production during peak demand periods. To address this issue, this study proposes a novel inlet air cooling (IAC) system for improving the performance of IcGTCC in hot regions.

How to reduce inlet air temperature of Chabahar gas turbine?

To reduce inlet air temperature of the gas turbine, an absorption cooling system is used, in which a heat-recovery steam generator is used to feed the chilling system. The results showed that using a lithium bromide absorption chiller system can increase the output power of the Chabahar gas turbine by about 11.3%.

What is a steam injected gas turbine?

The STIG method stands for steam injected gas turbine. The steam generated from the heat recovery steam generator (HRSG) is injected into the combustion chamber. Air from the compressor and steam from the HRSG both receive fuel energy in the combustion chamber and both expand inside the same turbine to boost the power output of turbine.
