Supercritical compression energy storage system

Overview

What is a supercritical compressed air energy storage system?

A novel supercritical compressed air energy storage system is proposed. The energy density of SC-CAES is approximately 18 times larger than that of conventional CAES. The characteristic of thermodynamics and exergy destruction is comprehensively analysed.

What is supercritical compressed carbon dioxide energy storage system (SC-CCES + CSTs)?

In this chapter, the supercritical compressed carbon dioxide energy storage system coupled with concentrating solar thermal storage (SC-CCES + CSTS) is designed. Two working principles and layouts of the above system will be introduced and displayed, respectively. The layout of a simple compression cycle has been displayed in Fig. 1 (a).

What are the physical properties of super-critical carbon dioxide energy-storage system (SC-CCES)?

Also its physical properties are those between a liquid and gas, and it has a high diffusion coefficient, low viscosity and high density [1]. Super-critical Compressed Carbon dioxide Energy-Storage (SC-CCES) system is a novel energy-storage system that uses SC-CO₂ to replace air as working fluid.

What is compressed air energy storage?

New compressed air energy storage concept improves the profitability of existing simple cycle, combined cycle, wind energy, and landfill gas power plants. ASME Turbo Expo 2004: power for land, sea, and air. American Society of Mechanical Engineers; 2004. p. 103–10.

How is supercritical air cooled?

The supercritical air is cooled to liquid state by the stored cold energy in the cold storage/heat exchanger and then expanded to atmospheric pressure

using the valve or liquid expander.

How to evaluate exergy efficiency of compression process & expansion process?

In order to evaluate the studied processes better, both exergy efficiency of compression process and that of expansion process are defined as shown in Eqs. (25), and (26) respectively. (25) $\eta_{e,c} = \frac{\Delta E_{air} + \Delta E_w}{W_c}$ where $\eta_{e,c}$ is the exergy efficiency of compression process, ΔE_{air} , ΔE_w is the exergy change of air and water, respectively.
