The impact of photovoltaic price reduction on energy storage

Overview

The National Renewable Energy Laboratory (NREL) publishes benchmark reports that disaggregate photovoltaic (PV) and energy storage (battery) system installation costs to inform SETO's R&D investment decisions. This year, we introduce a new PV and storage cost modeling approach.

The National Renewable Energy Laboratory (NREL) publishes benchmark reports that disaggregate photovoltaic (PV) and energy storage (battery) system installation costs to inform SETO's R&D investment decisions. This year, we introduce a new PV and storage cost modeling approach.

For this year's benchmark report, the Solar Energy Technologies Office developed a new bottom-up PV and storage cost model with NREL analysts to make the benchmarks simpler and more transparent—while expanding the model to address components not previously benchmarked.

The 2022 Cost and Performance Assessment provides the levelized cost of storage (LCOS). The two metrics determine the average price that a unit of energy output would need to be sold at to cover all project costs inclusive of taxes, financing, operations and maintenance, and others.

The global weighted-average levelized cost of electricity (LCOE) of utility-scale solar PV, onshore wind, and battery storage has fallen by 77%, 35%, and 85% between 2010 and 2018, respectively.

During the past decade, solar power has experienced transformative price declines, enabling it to grow to supply 1% of U.S. and world electricity. Addressing grid integration challenges, increasing grid flexibility, and further reducing cost will enable even greater potential for solar as an electricity source. Are solar photovoltaics costing more?

Provided by the Springer Nature SharedIt content-sharing initiative The costs for solar photovoltaics, wind, and battery storage have dropped markedly since 2010, however, many recent studies and reports around the world have not adequately captured such dramatic decrease.

What is PV and storage cost modeling?

This year, we introduce a new PV and storage cost modeling approach. The PV System Cost Model (PVSCM) was developed by SETO and NREL to make the cost benchmarks simpler and more transparent, while expanding to cover components not previously benchmarked.

Are soft costs affecting solar installation costs?

As in previous years, soft costs remain a large and persistent portion of installation costs, for both solar and storage systems, and especially for commercial and residential systems. “A significant portion of the cost declines over the past decade can be attributed to an 85% cost decline in module price.

Are solar PV prices going down?

Nonetheless, rapid price declines in solar PV have not been without controversy. China, for example, has played an outsized role in scaling up the mass production of solar PV cells and modules, comprising 78% of global production in 2021 9, 10 (Fig. 1).

Could low-cost storage be the future of PV?

Furthermore, achieving the 2030 cost targets with low-cost storage available could lead to PV deployment in excess of 1600 GW ac in 2050, which could serve approximately half of total U.S. electricity demand. Achieving these aggressive cost reductions requires high levels of continued innovation.

Are cost reductions still a major challenge for PV?

However, cost reductions are no longer the only significant challenge for PV—addressing grid integration challenges and increasing grid flexibility are critical as the penetration of PV electricity on the grid increases.
