# The role of the wind in and out of the generator

## Overview

---

The wind blows the blades of the turbine, which are attached to a rotor. The rotor then spins a generator to create electricity.

The wind blows the blades of the turbine, which are attached to a rotor. The rotor then spins a generator to create electricity.

The turbine's blades, which are like the propellers of an airplane or helicopter, use the aerodynamic force of the wind to turn a rotor, which spins a generator.

The energy in the wind turns two or three propeller-like blades around a rotor. The rotor is connected to the main shaft, which spins a generator to create electricity. Click NEXT to learn more.

The wind rotates the blades, the blades rotate the drive shaft, and the drive shaft rotates the millstones.
