Overview

What is a thin-film solar PV system?

This is the dominant technology currently used in most solar PV systems. Most thin-film solar cells are classified as second generation, made using thin layers of well-studied materials like amorphous silicon (a-Si), cadmium telluride (CdTe), copper indium gallium selenide (CIGS), or gallium arsenide (GaAs).

Who invented thin-film solar panels?

The idea for thin-film solar panels came from Prof. Karl Böer in 1970, who recognized the potential of coupling thin-film photovoltaic cells with thermal collectors, but it was not until 1972 that research for this technology officially started.

Can thin-film floating solar systems be used at offshore locations?

How much does a thin-film solar cell cost?

The rated efficiency for GaAs thin-film solar cells is recorded at 29.1%. The cost for these III-V thin-film solar cells rounds going from \$70/W to \$170/W, but NREL states that the price can be reduced to \$0.50/W in the future.

What materials are used for thin-film solar technology?

The most commonly used ones for thin-film solar technology are cadmium telluride (CdTe), copper indium gallium selenide (CIGS), amorphous silicon (a-Si), and gallium arsenide (GaAs). The efficiency, weight, and other aspects may vary between materials, but the generation process is the same.

What are the applications of thin-film solar technology?

One of the most important applications for thin-film solar technology, specifically Copper Indium Gallium Selenide (CIGS) and Gallium Arsenide (GaAs) technology is the space applications.
