The as-proposed TWE for high-energy-density and long-cycling Li-S batteries is composed of DME, DIPS, and TXA with 1.0 M lithium bis-(trifluoromethanesulfonyl) imide (LiTFSI). Specifically, DME is employed to maintain high LiPS solubility and smooth cathode conversion kinetics due to its strong solvating power.

Communications Materials - Three-dimensional silicon-based lithium-ion microbatteries have potential use in miniaturized electronics that require independent energy storage. Here, their.

The aim of this study is to address the lack of comprehensive cradle-to-grave environmental impact evaluation for stationary Li-ion batteries. Three stationary Li-ion batteries are assessed here: a prototype lithium iron phosphate/graphite (LFP/G) battery and two alternatives (with nickel manganese cobalt (NMC) positive electrodes and graphite).

In summary, toward the practical scale-up of Li-S battery, a synergistic strategy was reported in this paper to densify the sulfur cathode and stabilize the lithium anode by a 3D graphene design, consequently achieving the high energy yet long-cycle performance in Li-S battery.
