Understanding and knowledge of solar power generation

Overview

How solar power works
Step 1: Solar panels capture sunlight The process of solar power is explained beginning with solar panels. Step 2: Conversion of sunlight into electricity The electric current generated by the solar cells is direct current (DC). Step 3: Distribution of electricity . Step 4: Excess power goes back to the grid . Step 5: Power at night .

Solar energy is energy from the Sun, which can be harnessed in several ways. Solar panels use the photovoltaic effect to generate electricity directly from sunlight.

Solar power plants use one of two technologies: Photovoltaic (PV) systems use solar panels, either on rooftops or in ground-mounted solar farms, converting sunlight directly into electric power. Concentrated solar power (CSP) systems use mirrors or lenses to concentrate sunlight to extreme heat to make steam, which is converted into electricity by a turbine.

Solar panels, also known as photovoltaics, capture energy from sunlight, while solar thermal systems use the heat from solar radiation for heating, cooling, and large-scale electrical generation.

What is photovoltaic (PV) technology and how does it work?

PV materials and devices convert sunlight into electrical energy. A single PV device is known as a cell.
