When building a PV array, you need a few important numbers. These numbers are your inverter's maximum input voltage and your PV array voltage. Your PV array voltage is the total voltage of all of your modules when connected in a series. The more modules connected in series, the higher your array voltage.

This article introduces the architecture and types of inverters used in photovoltaic applications. Inverters belong to a large group of static converters, which include many of today's devices able to "convert" electrical parameters in input, such as voltage and frequency, so as to produce an output that is compatible with the .

Fluctuations are observed in reactive power before and after PV inverter operation. According to (González et al., 2011), when the PV inverter provides reactive power compensation, it should operate with a power factor above 0.9 when output exceeds 10% of the nominal power.
