Voltage insulation impedance change of photovoltaic panels

Overview

Correction of the I-V curve permits the comparison of curves measured under different conditions for photovoltaic (PV) panels' health monitoring purpose. IEC 60891 has defined three standard procedures named 1, 2 and 3 for the correction. They were initially designed to correct the curves of healthy PV panels.

Further, the effect of variations in temperature and solar irradiance on electrical parameters such as s/c current, Fill-Factor, o/c voltage, and high-power conversion efficiency have been also analyzed. 2. Need for modeling of solar cell.

High voltage system in PV inverters operation requires a safe insulation resistance between the PV panel to ground. A poor insulation resistance less than $1\text{M}\Omega$ leads to a high leakage current (about 1mA), which not only will damages the system but also injure the user.

To validate that the PV modules are safe when exposed to rain or dew, an insulation resistance test is done with the PV modules in a wet state. This is to record the effect of shading by obstacles. The international standard for testing, documenting, and maintaining grid-connected PV systems is IEC 62446-1.

To safely measure the insulation resistance of PV modules, it is recommended to conduct the measurement with a method that does not involve a short circuit. Also it is important to use a insulation meter that can measure accurately even when the current from the PV modules flows through a closed loop. How to measure the insulation resistance of PV modules?

How do you measure the insulation resistance of a PV inverter?

One method is to measure the insulation resistance of each panel with respect to ground. This indirectly also measures the leakage current. The measurement is usually done before the turning on of the PV inverter or at least once or twice per day. For a 1000 Vdc system, normal practice requires insulation resistance to be more than 1 MΩ.

Does I-V correction work on defective photovoltaic panels?

In this work, we have evaluated the performance of methods based on one or more curves proposed in the IEC 60891 standard for the correction of I-V curves measured on defective photovoltaic panels. It has been shown that all the methods introduce significant errors due to irradiance, module temperature and the severity of the defects.

Do solar PV systems need insulation inspections?

This aids in preventing electrical shocks and short circuits. The same is true for solar photovoltaic (PV) systems, which need periodic and post-installation insulation inspections. The IEC62446-1 standard describes two methods for measuring the insulation resistance of a solar PV system.

What is improved correction method for photovoltaic (PV) curves?

Improved correction method is proposed and outperforms original methods. Correction of the I-V curve permits the comparison of curves measured under different conditions for photovoltaic (PV) panels' health monitoring purpose. IEC 60891 has defined three standard procedures named 1, 2 and 3 for the correction.
