## Overview

---

In 2009, world pumped storage generating capacity was 104 , while other sources claim 127 GW, which comprises the vast majority of all types of utility grade electric storage. The had 38.3 GW net capacity (36.8% of world capacity) out of a total of 140 GW of hydropower and representing 5% of total net electrical capacity in the EU. had 25.5 GW net capacity (24.5%.

Pumped storage hydropower facilities use water and gravity to create and store renewable energy.

Pumped storage hydropower facilities use water and gravity to create and store renewable energy.

Pumped storage hydropower offers services such as system inertia, frequency control, voltage regulation, storage and reserve power with rapid mode changes, and black-start capability.

batteries, flywheels and supercapacitors. In essence, an energy storage system can act as a virtual reservoir, making it possible for a ROR hydropower plant to adjust the amount of power it puts on. What is a pumped storage hydropower facility?

Pumped storage hydropower facilities use water and gravity to create and store renewable energy. Learn more about this energy storage technology and how it can help support the 100% clean energy grid the country—and the world—needs.

How does pumped storage hydropower work?

PSH facilities store and generate electricity by moving water between two reservoirs at different elevations. Vital to grid reliability, today, the U.S. pumped storage hydropower fleet includes about 22 gigawatts of electricity-generating capacity and 550 gigawatt-hours of energy storage with facilities in every region of the country.

Can hydropower be used to store electricity?

Hydro can also be used to store electricity in systems called pumped storage

hydropower. These systems pump water to higher elevation when electricity demand is low so they can use the water to generate electricity during periods of high demand. Pumped storage hydropower represents the largest share (> 90%) of global energy storage capacity today.

What is pumped storage hydropower (PSH)?

Pumped storage hydropower (PSH) is one of the most-common and well-established types of energy storage technologies and currently accounts for 96% of all utility-scale energy storage capacity in the United States. PSH facilities store and generate electricity by moving water between two reservoirs at different elevations.

What is pumped-storage hydroelectricity?

Pumped-storage hydroelectricity (PSH), or pumped hydroelectric energy storage (PHES), is a type of hydroelectric energy storage used by electric power systems for load balancing. A PSH system stores energy in the form of gravitational potential energy of water, pumped from a lower elevation reservoir to a higher elevation.

What is a storage hydroelectric system?

Storage hydroelectric systems store water for later use, which makes them a versatile resource for the grid. For example, large hydroelectric dams can be sited on rivers with valleys, creating an artificial lake or reservoir. Turbines and generators in the powerhouse generate electricity when water flows from higher-to-lower elevation.
