Which type of wind turbine blade is best

Overview

The “best” blade design for wind turbines is determined by several key factors: aerodynamic efficiency, cost-effectiveness, durability, and minimal environmental impact.

The “best” blade design for wind turbines is determined by several key factors: aerodynamic efficiency, cost-effectiveness, durability, and minimal environmental impact.

How many blades are best for a wind turbine?

Put simply: more blades are better for low winds, while fewer blades means more efficiency. For residential wind turbines, these differences are minor.

But to obtain the best design for wind turbine blades we can improve the aerodynamics and efficiency even more by using twisted, tapered propeller-type rotor blades. Twisting the blade changes the wind angle along the blade with the combined effect of twisting and tapering the blade along its length improves the angle of attack increasing .

The most common type of wind turbine is the ‘Horizontal Axis Wind Turbine’ (HAWT). It is referred to as a horizontal axis as the rotating axis lies horizontally (see diagram, below). A HAWT needs to point directly into the wind to operate at maximum efficiency, and the whole head is designed to turn to face the wind.

The review provides a complete picture of wind turbine blade design and shows the dominance of modern turbines almost exclusive use of horizontal axis rotors. The aerodynamic design principles for a modern wind turbine blade are detailed, including blade plan shape/quantity, aerofoil selection and optimal attack angles.
