Will the photovoltaic grid-connected inverter have overcurrent

Overview

The grid connected current will not have overcurrent, which can be ensured by the LVRT strategy of single closed-loop control.

Abstract—Grid-forming (GFM) inverters are increasingly recognized as a solution to facilitate massive grid integration of inverter-based resources and enable 100% power-electronics-based power systems. However, the overcurrent characteristics of GFM inverters exhibit major differences from those of conventional synchronous machines.

Under grid voltage sags, over current protection and exploiting the maximum capacity of the inverter are the two main goals of grid-connected PV inverters.

This paper aimed to demonstrate the reliability of the Over Current protection (OCP) scheme in protecting microgrids with inverter interfaced RES for low voltage distribution networks. To prove this reliability, the PSCAD/EMTDC simulation software was used to conduct simulations for the OCP scheme, while comparing throughout grid-connected mode .

What are the goals of grid-connected PV inverters?

Under grid voltage sags, over current protection and exploiting the maximum capacity of the inverter are the two main goals of grid-connected PV inverters. To facilitate low-voltage ride-through (LVRT), it is imperative to ensure that inverter currents are sinusoidal and remain within permissible limits throughout the inverter operation.

How do grid-tied PV inverters work?

When a fault (such as a short circuit, flickering, or loss of grid power) occurs on the grid, even if it is transient in nature, the conventional grid-tied PV inverters automatically cut themselves off from the grid. The inverters are configured in this fashion to prevent damage from transients of over current or over voltage.

What is over current protection mechanism in PV inverter?

As previously discussed, the simultaneous injection of peak active power from PVs and reactive power into the grid for voltage support can trigger the over current protection mechanism in PV inverter. The triggering of over current protection will lead to disconnection of inverter from the grid which is unfavourable during LVRT period.

Does grid connected current have overcurrent?

The grid connected current will not have overcurrent, which can be ensured by the LVRT strategy of single closed-loop control. However, in case of fault, this method cannot ensure the DC bus will not experience overvoltage.

How do inverters work under normal grid voltage?

Under normal grid voltage, the inverter works under the condition of unit power factor, Q ratio = 0, and the output reactive power is 0 at this time; During the voltage drop, it is necessary to provide reactive energy for grid voltage recovery Q ratio. The inverter can output the reactive current according to (3).
