How does a wind turbine work?

A small anemometer and wind vane on top of the wind turbine electronically tell a controller which way to point the rotor into the wind. Then the "yaw drive" mechanism turns gears to point the rotor into the wind. Maintenance Hoist. Generator: 800 kW, Induction, 4 poles, 690 Volts. Top Control unit.

How does a wind turbine gearbox work?

The gearbox converts the turning speed of the blades 15 to 20 rotations per minute for a large, one-megawatt turbine into the faster 1,800 revolutions per minute that the generator needs to generate electricity. A gearbox is typically used in a wind turbine to increase rotational speed from a low-speed rotor to a higher speed electrical generator.

What is a rotor blade in a wind turbine?

The rotor blades are the three (usually three) long thin blades that attach to the hub of the nacelle. These blades are designed to capture the kinetic energy in the wind as it passes, and convert it into rotational energy. The largest wind turbines being manufactured in the world (as of 2021) are 15MW turbines.

How does a windmill work?

A turbine, like the ones in a wind farm, is a machine that spins around in a moving fluid (liquid or gas) and catches some of the energy passing by. All sorts of machines use turbines, from jet engines to hydroelectric power plants and from diesel railroad locomotives to windmills. Even a child's toy windmill is a simple form of turbine.

How do wind turbine blades work?

The turbine blades are adjusted from their base hub using a system of gears and small motors or hydraulics. This system, called pitch control, can be

electric or mechanical. It swivels the blades to align with wind speed, ensuring they capture the most wind energy efficiently.

What is the rotational speed of a wind turbine?

Usually the rotational speed of the wind turbine is slower than the equivalent rotation speed of the electrical network: typical rotation speeds for wind generators are 5–20 rpm while a directly connected machine will have an electrical speed between 750 and 3600 rpm. Therefore, a gearbox is inserted between the rotor hub and the generator.
